**Please add the following new Abstract of the Disclosure:**

A device for accessing a telecommunication network, allowing the transmission of multimedia data flows. The device allows transmission data flows between at least one first telecommunication client connected to the core network via an access network possessing throughput performances lower than the core network and at least one second telecommunication client. The device has a function to degrade at least one quality parameter of at least one data flow. The degradation is carried out using a module associated with each session.
